

# INSTRUCTIONS

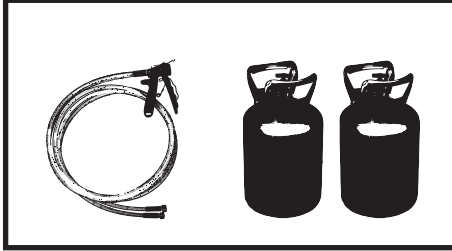

## clean kit adapter

### 1. Empty hoses

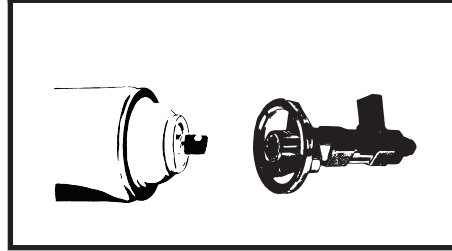

After use, close cylinder valves and keep gun opened for at least 45 seconds to make sure the hoses are completely empty and pressure free.

### 2. Disconnect hoses

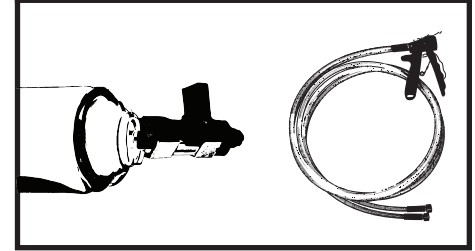

Disconnect the hoses from the cylinders.

### 3. Can to adaptor

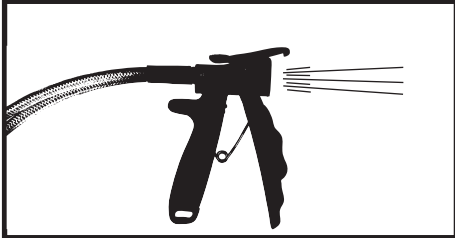

Connect the PU cleaner can to the Clean Kit Adaptor (CKA). Make sure CKA valve is closed (vertical, as on drawing above).

### 4. Adaptor to hose

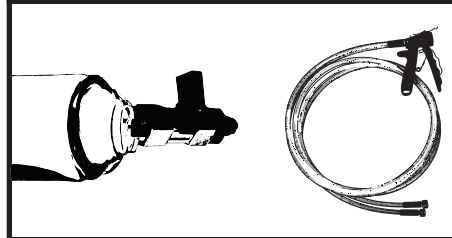

Connect red hose to the other side of the CKA.

### 5. Clean red hose

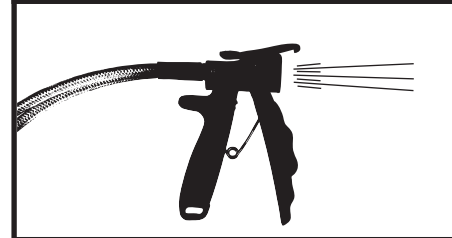

Turn CKA valve open. Pull trigger and hose will automatically be flushed. Do this until you see all (yellow) substance is out of the hose.

### 6. Connect other hose

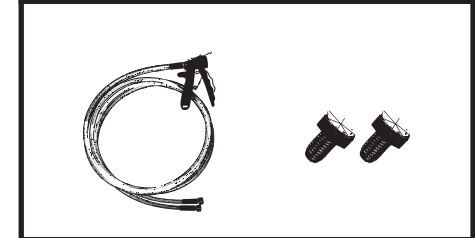

Close CKA valve and disconnect red hose from adapter. Now reconnect the CKA to the blue hose.

### 7. Clean blue hose

Flush blue hose by turning ball valve from the CKA open and pulling the trigger.

### 8. Screws on hose

If hoses are not being used for some time, shut off by using the 2 screws. That way, air and oxygen cannot enter the hoses.
